

New England Patriots' Gillette Stadium

High profile projects like sports facilities require teams not only on opening day, but behind the scenes. A skilled construction team must carry out the design and construction, on time and within the owner's budget. Structural-Heavy Steel Construction joined the New England Patriots design-build team to assist in the steel portion of the job and did just that and more.

Structural arrived at design meetings armed with ideas for simplifying steel bracing, framing and connections which provided options that not only kept the ball in play with schedule requirements, but also reduced costs and helped keep within original budget projections.
